Mbuti

pure hunting and gathering economy at work not only side by side with, but in opposition to, a cultivation economy. With the pygmoid Twa and Tswa, and possibly only excepting a few small groups in the Gabon and among the Ubangi Binga pygmies, the rest of the population of pygmy hunters and gatherers has become largely dependent for food upon cultivation, either by adopting it themselves or by entering into symbiosis with neighboring village farmers. The Mbuti solution to the contact situation is very different, and so it is in its contemporary context that we study it; any light the study may throw on an earlier form of pygmy society is incidental.

The habitat of the Mbuti is the Ituri Forest. This is a primary rain forest that runs across the equator from the fringes of the Saharan desert, in the north, into the Kivu mountains, in the south. To the east it is bounded clearly by a succession of lakes (Lake Albert, Lake Edward and Lake Kivu) but to the west the boundary is less definable, the forest thinning out as it approaches the Congo River's commercial centers. Effectively, the Mbuti occupy only the dense forest where the migration of game and the nature of vegetation have alike been virtually unaffected by outside influences. Their forest home, some 50,000 square miles in extent, is traversed by a number of roads built, for the most part, since the 1930's, but the purpose of the roads has been merely for transport and has not led to any significant exploitation of the forest, which in most places comes right to the very edge of the roadway (see Map 4).[1]

There are a number of significant features concerning the forest that have to be taken into account. In general it is considered as generous and friendly from the point of view of the Mbuti hunters and gatherers, and as niggardly and hostile from the point of view of the villager cultivators.

For example, the forest is, in most places, gently undulating, though even the mountainous sections in the east and in the south are as thickly wooded at their highest points as at the lowest. In all the territory to the north of the Kivu mountains the average height above sea level is somewhere around a thousand meters. This height, together with the over-all denseness of the forest, and an almost daily rainfall that averages from 70 to 80 inches per year, makes the temperatures within the forest remain remarkably constant and agreeable, seldom departing far from either side of 80° F., never below 70° or above 90°. The relative humidity is fairly constant at 95 per cent.
